PROBLEM:
Delta Meat & Sausage Company required a protective coating for the walls and ceilings of their food processing plant. Fiberglass Reinforced Plastic (FRP) panels were considered, but ruled out due to the need for a seamless membrane. Seamless membranes are essential for sanitation purposes because they are easily cleaned and maintained. Additionally, it was important to find the most time-efficient option available to minimize the facility's downtime.

SOLUTION:
Polyshield SS™ 100 was chosen because of its elasticity and ability to be applied seamlessly. White Polyshield SS™ 100 HP was applied to coat and seal 10,000 square feet of sheet rock on the walls, ceilings, steel beams, and concrete stairs. The polyurea coating was also used to protect the doors, door jams, and the stairwells.

RESULTS:
Not only were the owners satisfied with the Polyshield SS™ 100, but the State of Alaska's Department of Environmental Conservation, was said to be very impressed with the application and the product.

December 1998: Polyshield SS™ 100 is doing a great job. The white yellowed quickly, but was not a concern to the owners who love the product and the application.
